

1    **ABSTRACT OF THE DISCLOSURE**

2            A vibration isolator for a ceiling fan includes a stationary tube, a  
3    rotatable tube, a compression spring and a torsional damping device. The  
4    rotatable tube is rotatably connected to the stationary tube. The compression  
5    spring is mounted between the stationary tube and the rotatable tube to reduce  
6    longitudinal vibrations. The torsional damping device is mounted between the  
7    stationary tube and the rotatable tube to reduce torsional force. Consequently, the  
8    longitudinal vibrations and the torsional forces caused by the ceiling fan will be  
9    diminished.
